Toxicity

These slight changes occur due to variations in the scrap (raw material) mix in the melting process of steel.

Volume

Volume has increased by 1,569,800 lbs. in 2011, as compared to 2010, K-061 flue dust is generated through the normal production process of steel in electric arc furnaces and controlled solely by production demands of steel facilities products.

No efforts were undertaken to reduce the volume of toxicity as there is no technology currently known to achieve this; however, recycling the material has been chosen as the most environmentally sound method available to Arkansas Steel Associates, L.L.C.

Certification

- 6) I certify under penalty of law that I have personally examined and am familiar with the information submitted in this and all attached documents, and that based on my inquiry of those individuals immediately responsible for obtaining the information, I believe that the submitted information, is true and accurate, and complete. I am aware that there are significant penalties for submitting false information including possibility of fine and imprisonment.

Sincerely,

Billy E. Ferguson
Manager, Environment
